CSS Position property

1. Static, relative, absolute, fixed, sticky
2. Static - default one.
3. relative - Same as Static; But lets you add top, right, bottom, left, makes it move relative to its normal position
4. absolute - Removes from the flow and positions absolute w.r.t parent. Parent has to be relative/absolute for top, right, bottom, left to work. Else it considers the main html element as parent.
